

CHOLERA AND DIARRHOEA TRANSMISSION CYCLE AND PREVENTION

Stop disease transmission by water and protect water from faecal contamination by;

- Defecating in the toilet and not in the open,
- Collecting baby's faeces and throwing them in the toilet pit or burying them.

Faeces are washed away by rain and contaminate water resources

Cholera and diarrhoea caused by drinking water contaminated by faeces.

Drinking water contaminated with germs from faeces causes diarrhoea and cholera

Stop disease transmission water and clean drinking water by;

- Boiling it for at least 3 minutes, or
- Leaving it in a clear plastic container in the sun for at least 8 hours, or
- Pouring 1 teaspoon of bleach into 20-25 liters of water at least 1 hour before drinking, and
- Cleaning water containers and keeping them closed
- Using clean utensils to draw drinking water.

Decontamination of drinking water
